

In order to provide a comprehensive eye exam the doctors need to examine your retina. We offer two modes for this: A pharmacological dilation OR Optomap photography. With these types of procedures it allows the doctor to view areas that are not visible behind the eye to finding anything potentially vision threatening or life threatening.

The Optomap Imaging is a new technology taking the full peripheral view of the back of the eye; this will not have any side effects. The fee to perform the procedure of the Optomap will be \$39.

The dilation are eye drops that dilate the pupil, it does relax the eye muscle therefore it causes you to have blurred vision for up to 6 hours, and sensitivity to light with a longer process.

Please check one of the following:

_____ I would like the Optomap imaging.

_____ I would like to schedule a dilation.

_____ I am refusing medical assessment even though the importance of these health checks have been explained to me.

Reason: _____

Print Name: _____ Date: _____

Signature: _____
